Carbon Dashboard

Monthly Key Figures

Customer Efficiency (kg CO2 per ton of freight)

The bars indicate the average kg of carbon emissions per ton of freight transported in Land (road or rail/intermodal).

Emission Factor (g per tkm)

The Emission Factor (g CO2/tkm) indicates the carbon intensity per tkm in Land (road or rail/intermodal) transport as an indicator of transport energy efficiency.

Basic calculation rules and data sources:

Road freight: EN 16258, routing according to Schenker Scheduler, country specific CoDi and linehaul fleet and filling rate (annually updated), database HBEFA 3.2. Emission calculation for shipments booked after 01.01.2020 is done in EcoTransit.
 Rail freight: European average emission factor according to EcoTransIT World

limitations:

- * Air freight data are solely based on database default data as long as there are no consistently calculated carrier data available
- * Road freight: There is no difference in the calculation between FTL and LTL transports. In case of significant deviations from the Schenker cargo mix/filling rate, an adjustment can be made.
- * All data are shipment based (STT number), irrespective of Incoterms and paying party.
